Sales & Financial Performance

Business Insight Report for the Interactive Sales Dashboard

Prepared by	Report purpose
Vetriselvan	Interpret the dashboard results, explain visible performance patterns and translate them into practical business actions.

Scope

Three supplied dashboard screenshots. The screenshots include two different displayed filter states; their totals are therefore presented separately and are not combined.

Executive Summary

The dashboard presents an overall displayed sales state with **4.71bn total revenue, 979.89M total profit, 4bn total cost, 112K total quantity and 15K transactions**. A second screenshot shows a narrower or otherwise different dashboard state with **1.90bn revenue, 395.18M profit, 1bn cost, 45K quantity and 6K transactions**. Because the filter selections differ, these values should be read as separate states rather than contradictory totals.

The category visuals show Mobile Phones and Laptops as the leading revenue contributors. The store-type donut indicates Urban as the largest visible segment in the first state. The city and store charts provide additional location-level comparisons. The monthly line chart should be used cautiously because the screenshot does not provide enough detail to verify the month sorting or exact values.

Headline KPIs - dashboard state shown in screenshots 1 and 3

Average Unit Price	Total Cost	Total Profit
41.99K	4bn	979.89M
Total Quantity	**Total Revenue**	**Total Transactions**
112K	4.71bn	15K

Second displayed state: Average Unit Price 42.28K; Total Cost 1bn; Total Profit 395.18M; Total Quantity 45K; Total Revenue 1.90bn; Total Transactions 6K. This state includes visible date, customer-segment, state and store-name filters.

1. Dashboard Overview

The dashboard combines six headline KPI cards with a set of visuals that explain revenue and profit by store type, product category, month, city and individual store. The second screenshot also shows interactive filters for date range, customer segment, state and store name.

Figure 1. Full dashboard view showing KPI cards and the revenue/profit visualisations.

The dashboard can be read from summary to detail: begin with revenue, cost and profit; review category and store-type mix; then inspect monthly, city and store comparisons. When filters are changed, the KPI cards and charts should be interpreted together as one filtered view.

How to use the dashboard

- Start with revenue, profit and cost together to understand the financial scale.
- Compare category revenue with category profit to avoid focusing on sales volume alone.
- Use city and store charts to identify locations contributing strongly to revenue.
- Apply date, segment, state and store filters consistently before comparing performance.

2. KPI and Financial Performance Analysis

The dashboard contains two sets of visible headline values. The first and third screenshots show the larger overall state; the second screenshot shows a different state with interactive filters displayed. The report keeps these states separate.

KPI	State A - screenshots 1 & 3	State B - screenshot 2	Interpretation
Average Unit Price	41.99K	42.28K	The displayed average unit price is similar across the two states.
Total Cost	4bn	1bn	Cost changes with the displayed dashboard state and its filter context.
Total Profit	979.89M	395.18M	Profit is substantial in both states; compare only after confirming identical filters.
Total Quantity	112K	45K	Quantity indicates the volume represented by each state.
Total Revenue	4.71bn	1.90bn	Revenue is the main scale measure used throughout the charts.
Transactions / Orders	15K transactions / 15K orders card	6K transactions	The third screenshot labels the 15K measure as Total Orders; the first labels it Total Transactions.

Financial reading

The displayed profit is lower than displayed revenue in both states, while cost forms a large part of the revenue base. The screenshot values are rounded and use compact units, so precise margin or reconciliation calculations should not be made from these cards alone. The report therefore retains the labels exactly as displayed and does not infer a precise profit margin.

3. Revenue Mix and Category Performance

Store-type revenue

In the first dashboard state, the donut chart identifies Urban as the largest store-type contribution at **298.03M (38.87%)**. Flagship contributes **182.8M (23.84%)** and Mall contributes **122.51M (15.98%)**. Online, Suburban and a separately labelled lowercase “urban” segment are smaller visible portions. The separate “Urban” and “urban” labels should be checked in the source data because they may represent inconsistent category spelling.

Category revenue

The category bar chart ranks Mobile Phones first, followed by Laptops and Televisions. Home Appliances, Audio, Wearables and Accessories appear as smaller contributors. The chart supports prioritising the leading categories while also examining profitability and growth potential in the smaller categories.

Category profit

The treemap shows Mobile Phones occupying the largest visible area, followed by Laptops and Televisions. Home Appliances, Audio, Wearables and Accessories occupy smaller areas. This broadly aligns the leading revenue categories with the largest visible profit contribution areas, although exact category profit values are not printed in the screenshot.

Figure 2. Revenue by store type and category, alongside category profit treemap.

4. Monthly, City and Store Performance

Monthly revenue trend

The monthly line chart displays revenue across month labels spanning 2024 and 2025. The line fluctuates within a relatively narrow visual band around the 0.2bn level, with several rises and falls. Exact monthly values are not printed. Before using this chart for seasonality or forecasting, confirm that month names are sorted chronologically and that the date range is consistent.

City revenue

Pune is the highest visible city in the chart, followed by Mumbai and New Delhi. Bengaluru appears next, with Chandigarh, Hyderabad, Online, Chennai, Gurgaon and Noida forming a lower group. This indicates that the visible revenue contribution is concentrated in a small group of leading city labels, while the remaining locations still contribute to the total.

Store revenue

The store chart places Bengaluru Orion Flagship and Pune Phoenix Marketcity at the top of the visible ranking. Chandigarh Mall, Pune Amanora Mall, Hyderabad Inorbit Mall, Mumbai Phoenix Flagship, Online Store and Chennai Phoenix Marketcity follow. The visual is scrollable, so the screenshot should be treated as the visible portion rather than a complete store ranking.

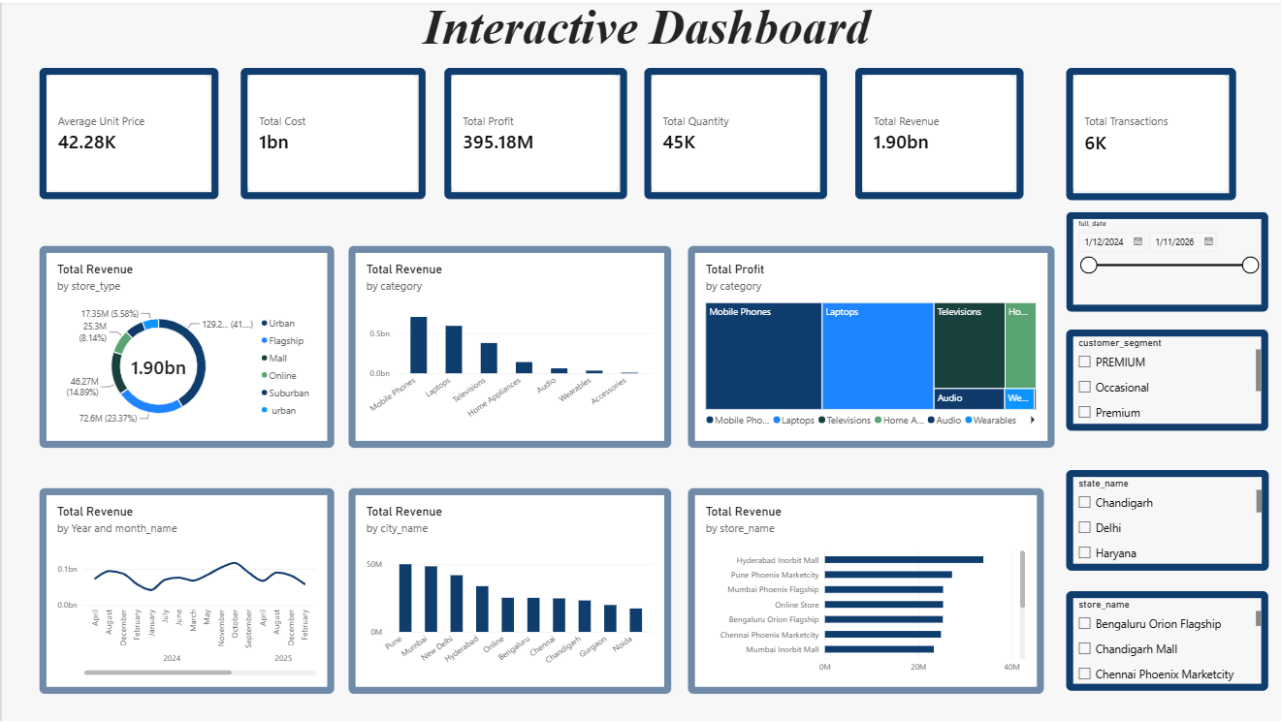

Figure 3. Filtered dashboard state with monthly, city and store comparisons and visible slicers.

5. Interactive Filters and Business Insights

The second screenshot displays a date range from 1/12/2024 to 1/11/2026, together with customer-segment, state-name and store-name selection lists. These controls allow users to focus on a selected time period, customer group, state or store. The selected values are not fully identifiable from the screenshot, so the displayed KPI set is described only as a separate dashboard state.

Key business observations

Observation	Business implication	Recommended action
Mobile Phones and Laptops lead visible category revenue and treemap area.	Performance depends materially on the leading product categories.	Protect stock availability and review category-level profit, pricing and promotion performance.
Urban is the largest visible store-type share; Flagship and Mall follow.	Store format mix may influence the revenue profile.	Compare cost and profit by store type before shifting investment or expanding locations.
Pune, Mumbai and New Delhi lead the visible city chart.	A few city markets contribute more revenue than the lower-ranked locations.	Set location-specific targets and investigate the product mix behind leading cities.
Two different KPI totals appear across screenshots.	The screenshots represent different filter states or report contexts.	Record the filter selections whenever exporting or comparing dashboard results.
The store chart is scrollable and some labels are abbreviated.	The screenshot does not show every store or exact value.	Use the interactive dashboard to inspect the full ranking before final decisions.

Additional recommendations

- Standardise store-type spelling, especially “Urban” and “urban”, to avoid fragmented reporting.
- Add exact data labels or a detail table for category profit and monthly revenue.
- Compare revenue, cost and profit under the same filter selections before evaluating performance.
- Review the highest-contributing cities and stores for practices that can be repeated elsewhere.
- Keep a documented default filter state for consistent monthly reporting.

Conclusion

The interactive dashboard provides a consolidated view of sales and financial performance across product categories, store types, months, cities and stores. In the larger displayed state, revenue is **4.71bn** and profit is **979.89M**, supported by **112K quantity** and **15K transactions/orders**. The second displayed state reports **1.90bn revenue** and **395.18M profit**, with **45K quantity** and **6K transactions**. These are separate views and should not be combined without confirming the filters.

Mobile Phones and Laptops are the strongest visible categories, while Urban is the leading store-type segment in the first state. Pune, Mumbai and New Delhi lead the visible city comparison, and Bengaluru Orion Flagship and Pune Phoenix Marketcity are prominent in the store ranking. Management should use the filters to validate these patterns, improve category and location profitability, and standardise data labels for clearer reporting.

Appendix: Data Notes

- All values and labels in this report are transcribed or interpreted from the three screenshots supplied by the user.
- Screenshot 1 shows KPI values of 41.99K average unit price, 4bn cost, 979.89M profit, 112K quantity, 4.71bn revenue and 15K transactions.
- Screenshot 2 shows a different displayed state: 42.28K average unit price, 1bn cost, 395.18M profit, 45K quantity, 1.90bn revenue and 6K transactions. Visible filters include date, customer segment, state and store name.
- Screenshot 3 repeats the larger-state totals and labels the 15K measure as Total Orders.
- Chart values not printed clearly in the screenshots are described by relative ranking or approximate visual position only; no missing values have been invented.
- The store ranking is scrollable, and therefore only the visible portion is discussed.
